BASIC-ABSTRACT:

NOVELTY - The present invention relates to a fermented glutinous $\underline{\text{rice}}$ richly-containing gamma-linoleic acid and production process of $\underline{\text{rice}}$ wine. The

described method includes the following steps: firstly, making saccharifying

mould rhizopus and/or mucor individually or together with distillers' yeast

undergo the processes of industion, activatino and culture for 1-72 hr.

simultaneously, then making inoculation into cooked and spary-cooled glutinous

<u>rice or rice</u> to make fermentation, said brewing fermentation can be divided

into two steps of induction fermentation and high-temp. fermentation

to obtain

fermented glutinous <u>rice</u> richly-containing gamma<u>-linolenic acid</u>.

Said

fermented glutinous $\underline{\text{rice}}$ can be made into wine-making mother material according

to the conventional process, then further fermented to obtain the invented rice

wine (yellow wine) richly-containing gamma-linoleic acid.
